

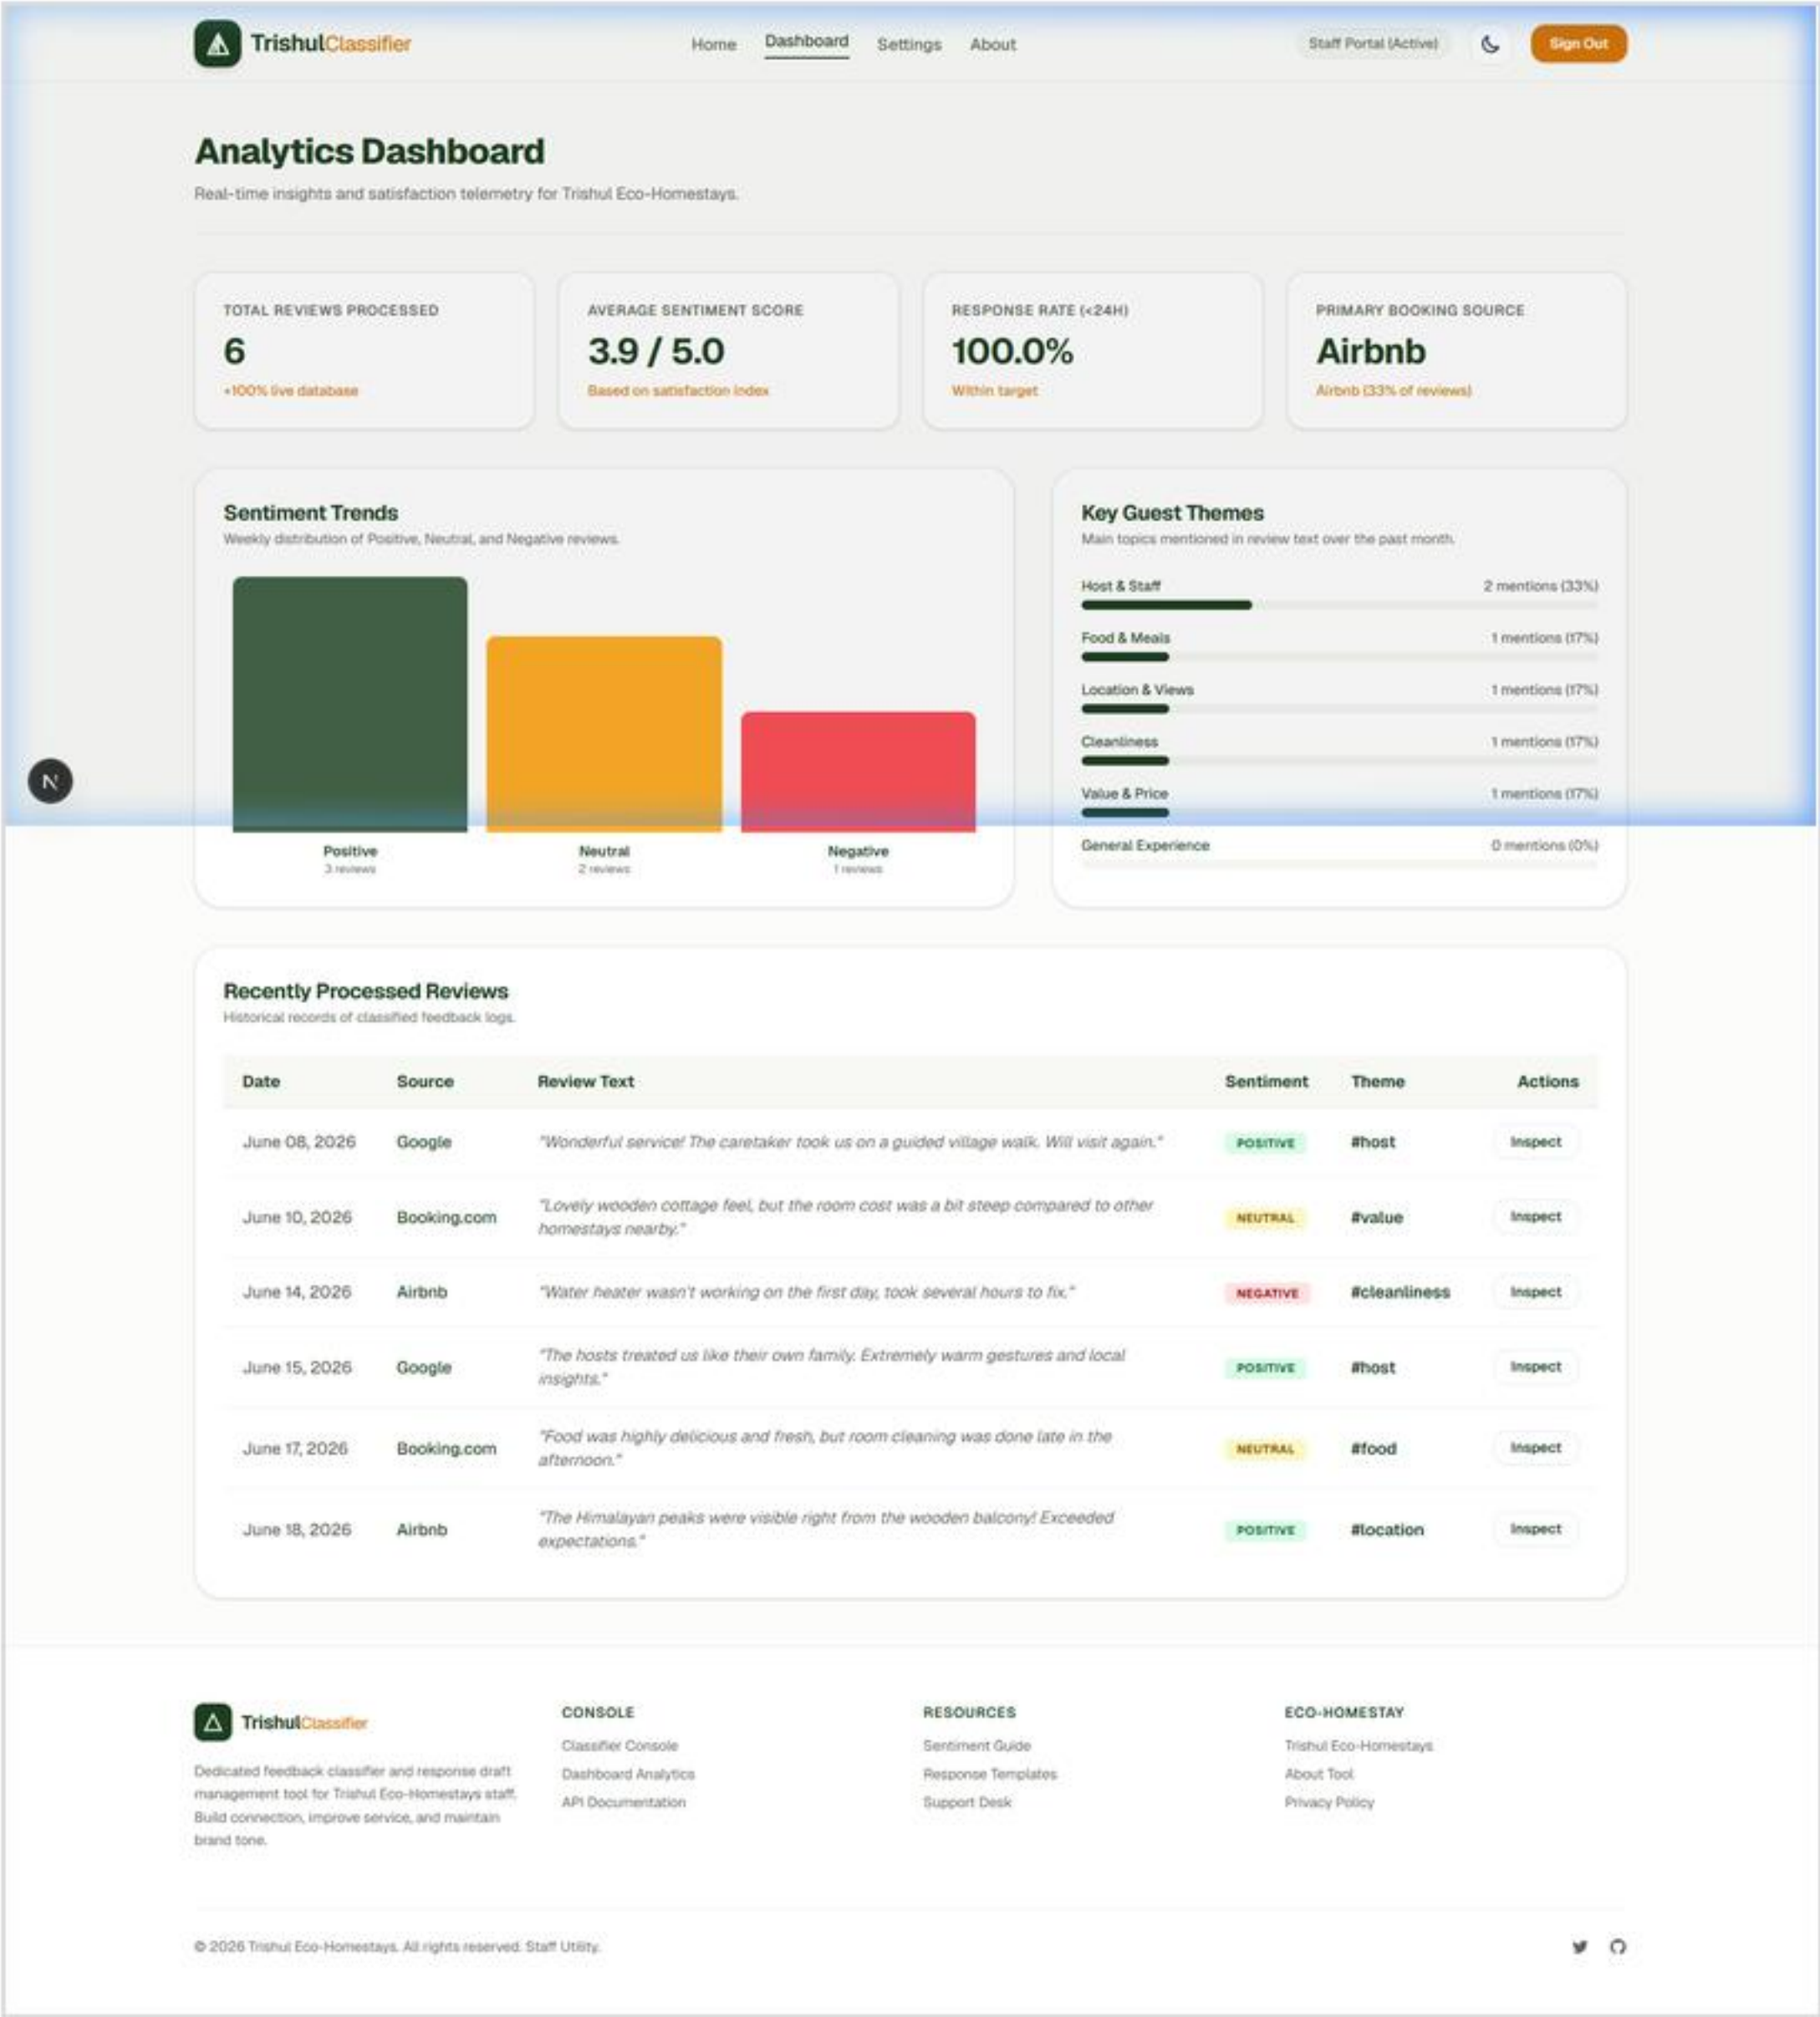

Figure 1: Trishul Eco-Homestays Staff Analytics Dashboard. The interface shows live telemetry analytics loaded dynamically from the backend GET /api/reviews/stats endpoint. Total reviews count, satisfaction metrics, theme distributions, and the 'Recently Processed Reviews' log table (populated via GET /api/reviews) refresh in real-time, verifying successful data flow between the Express database store and the Next.js React frontend.

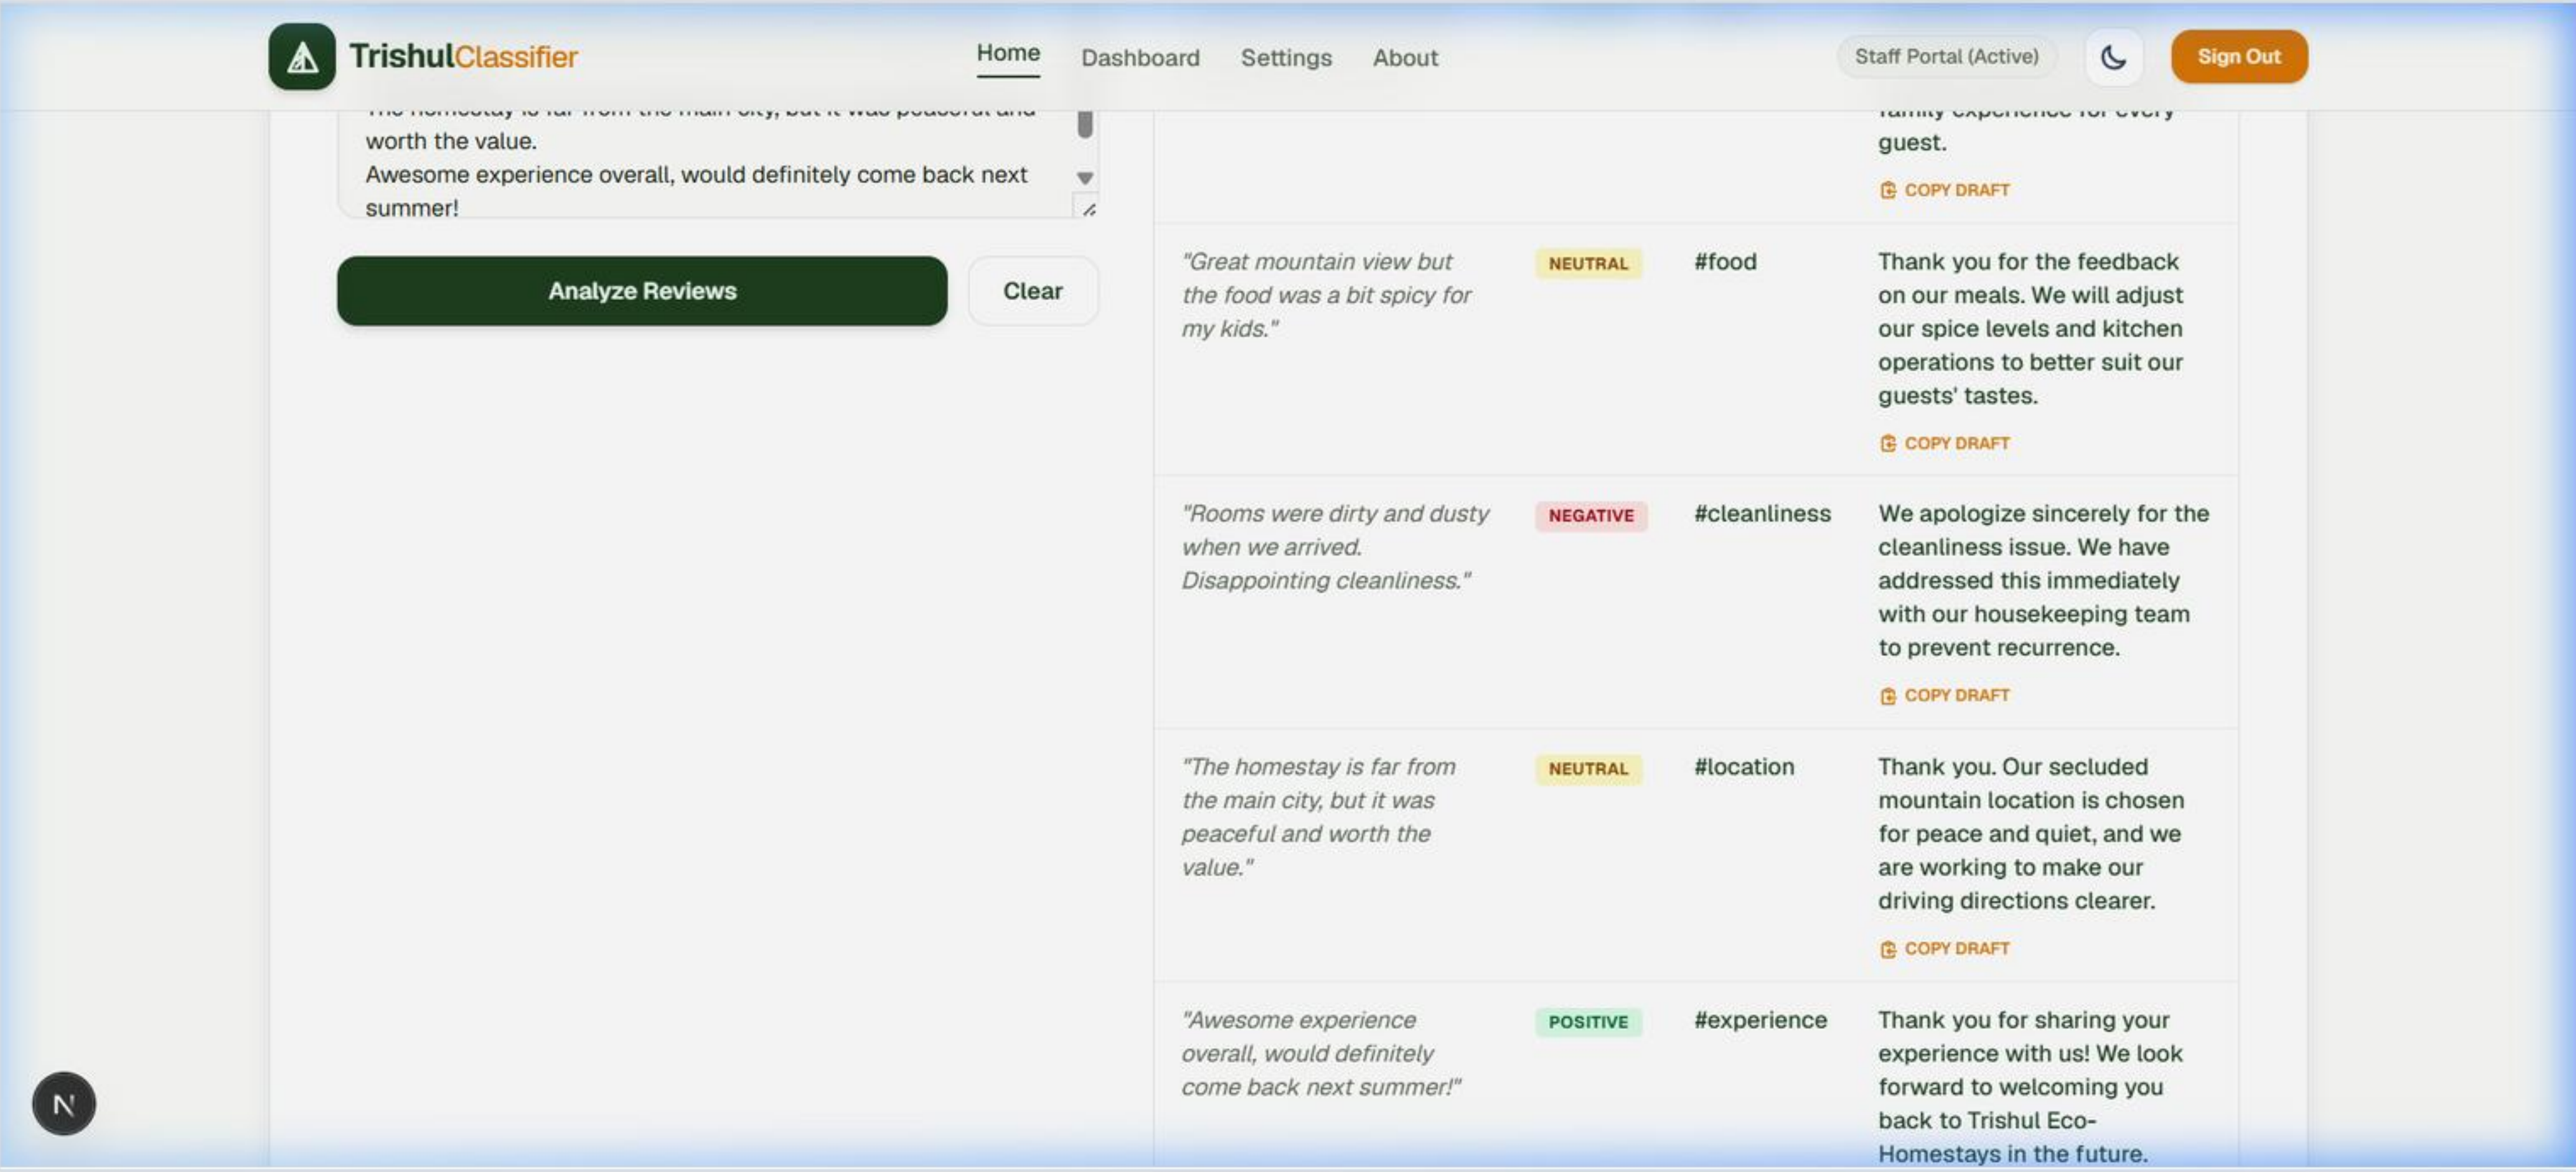

Figure 2: Review Classifier Console on the main landing page. When the user loads a sample batch of guest reviews and clicks 'Analyze Reviews', the frontend issues a POST request to the backend '/api/reviews/analyze' endpoint. The Express backend runs each feedback line through local rule-based heuristics or Gemini 1.5 Flash models to classify sentiment, theme, and draft welcoming responses, loading the results into the dynamic table.

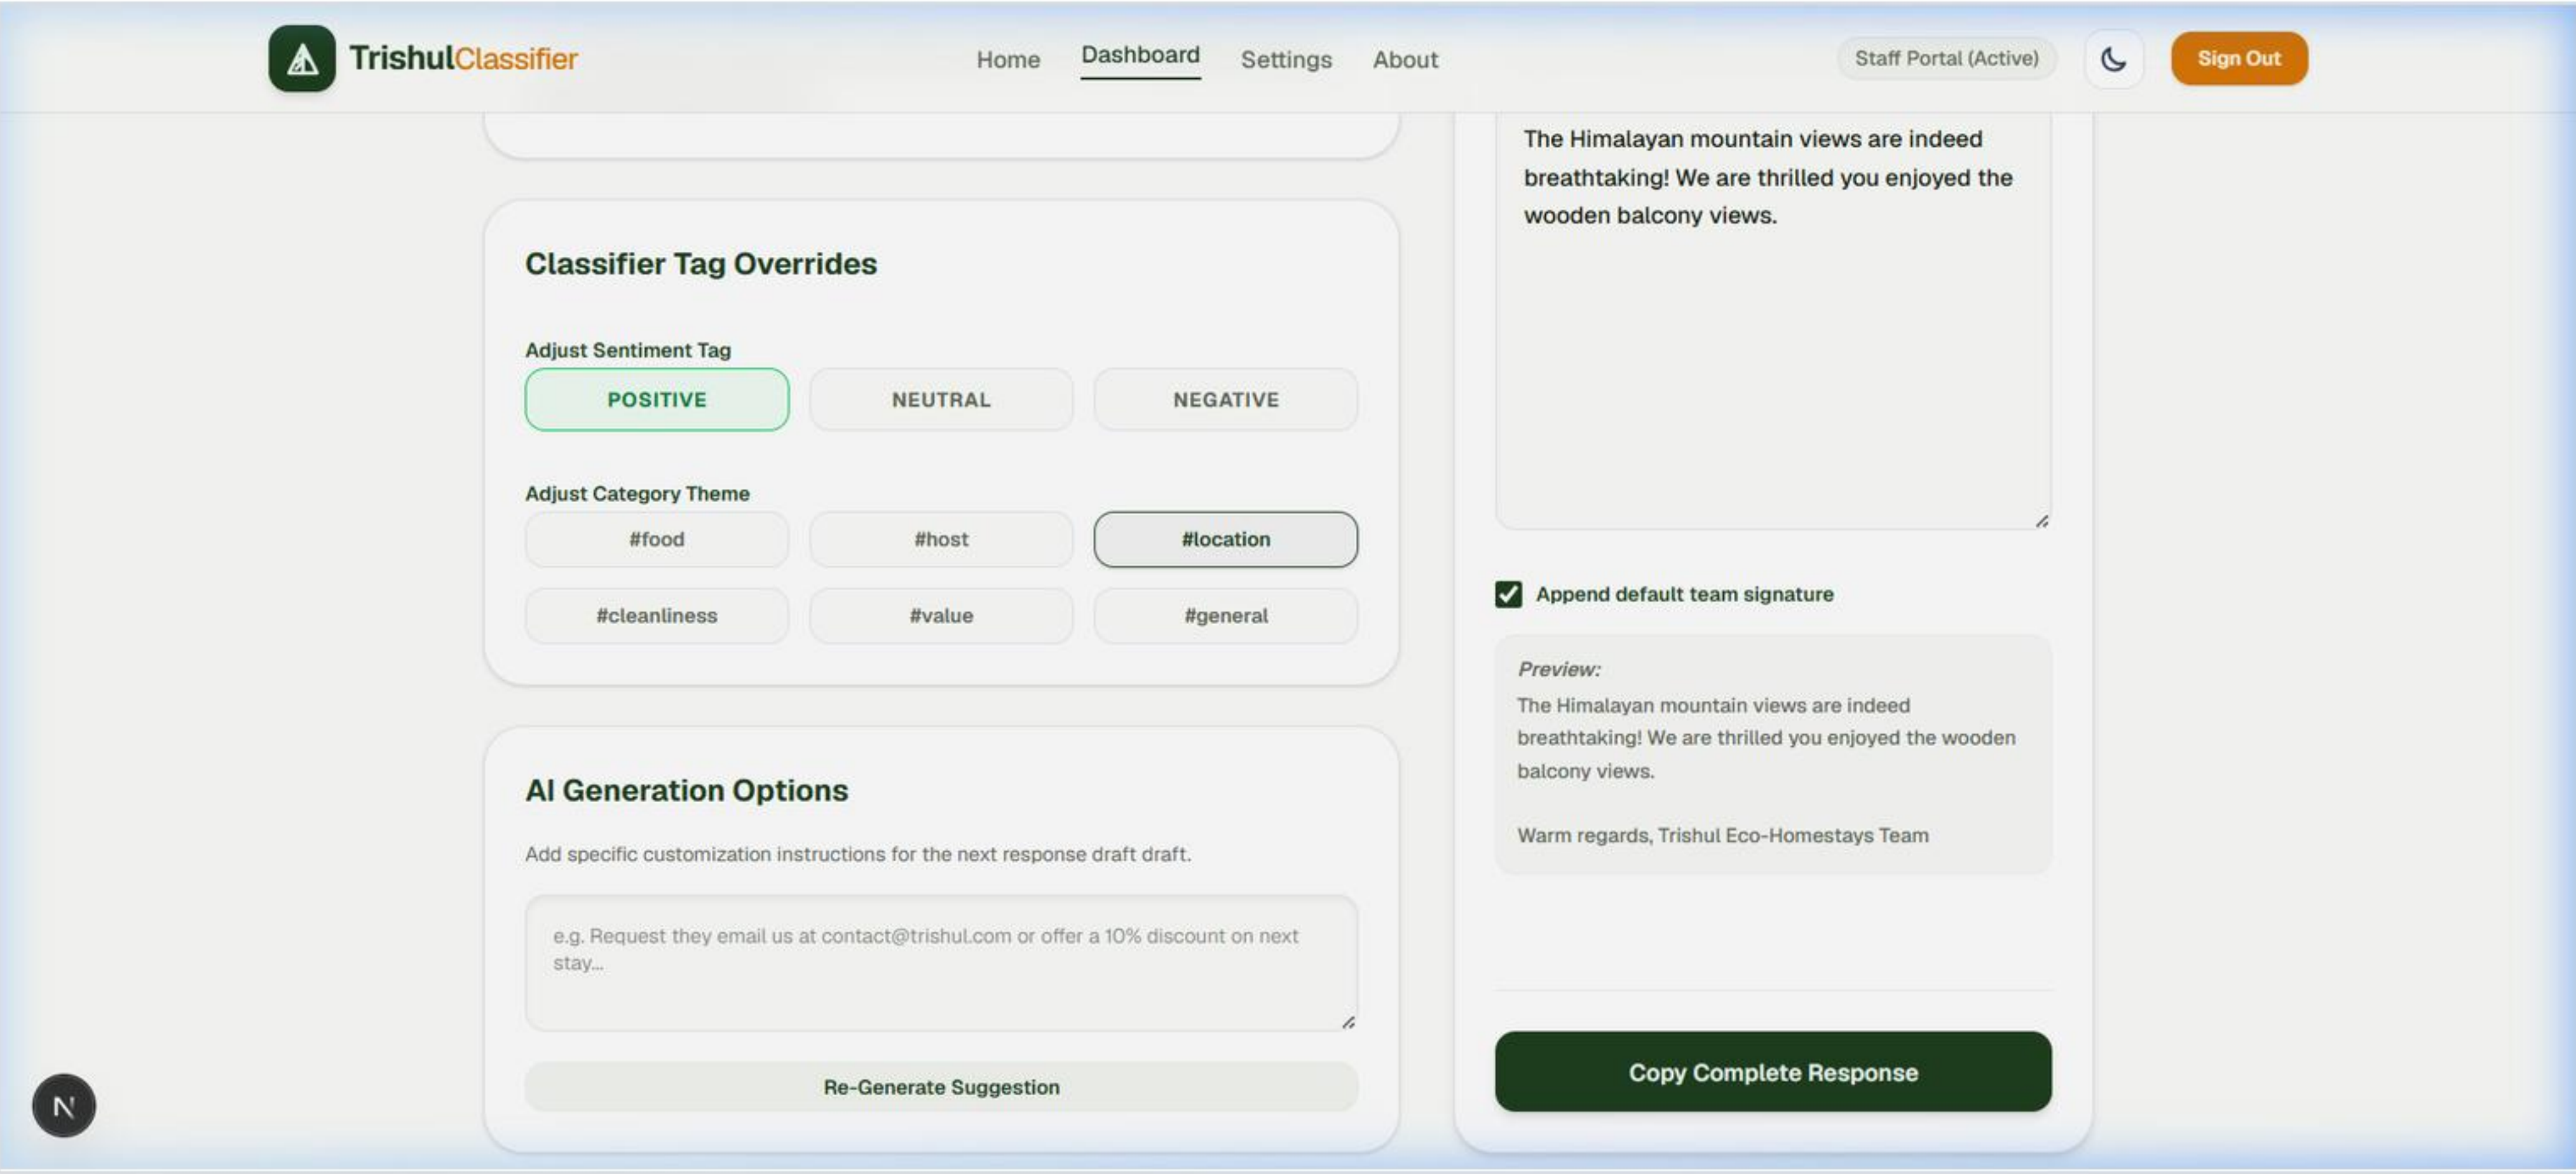

Figure 3: Review detail editing workspace (GET /api/reviews/:id). Staff members can adjust review sentiment and themes using custom selectors, or edit the suggested response draft. Tag selections immediately invoke a PUT /api/reviews/:id update request. The 'Delete Review' button invokes a DELETE /api/reviews/:id request, purging the record from memory and updating dashboard logs.

Figure 4: Chrome Developer Tools Network panel logging successful HTTP requests between the Next.js frontend (localhost:3000) and the Express.js API server (localhost:5000). The log shows successful GET requests for reviews list and analytics stats returning HTTP status 200 OK. POST requests for reviews analysis return HTTP status 201 Created. Modifications to review details return status 200 OK, and review deletion returns 204 No Content.
